Pain Clinic

Pain Clinic

Pain is an uncomfortable feeling that tells you something may be wrong. It can be steady, throbbing, stabbing, aching, pinching, or described in many other ways. Sometimes, it's just a nuisance, like a mild headache. Other times it can be debilitating. Pain brings a lot of suffering along with it. Proper pain control will minimize the suffering and help in faster recovery.

Pain can be broadly classified into chronic pain that is present for a long time and acute pain that is seen after an operation or trauma.

Chronic Pain: In pain clinic you will be evaluated by different experts like Pain Physicians, Orthopaedician, Neurologist etc and investigations are done to identify the root cause of the pain. Whenever the cause is identified then the definitive treatment is started in order to treat the cause. If the source of your pain can't be treated, or isn't known, the best way to treat the pain is to manage the symptoms. Our pain medicine specialists can offer options for pain control.

Pain control can be achieved by several ways like giving oral medication, intravenous injections or by precisely injecting drugs to the nerves which are involved in pain using radiological guidance. In most of the conditions we are likely to control the pain either totally or bring it down to an acceptable level.

Postoperative pain management: Following surgeries you are likely to have pain for sometime. In the immediate 2-3 days pain may be severe and disturbing. In pain clinic we can offer pain control by different ways like intravenous, epidural administration of medication to control this pain. Using electronically controlled pumps we can provide you pain medication whenever you need it with a push of a button (patient controlled analgesia).
